NAME

xzmore, lzmore - view xz or lzma compressed (text) files

SYNOPSIS

xzmore [filename ...] lzmore [filename ...]

DESCRIPTION

xzmore is a filter which allows examination of xz(1) or lzma(1) compressed text files one screenful at a time on a soft-copy terminal.

To use a pager other than the default **more**, set environment variable **PAGER** to the name of the desired program. The name **lzmore** is provided for backward compatibility with LZMA Utils.

- e or q When the prompt ---More---(Next file: *file*) is printed, this command causes **xzmore** to exit.
- **s** When the prompt ---More---(Next file: *file*) is printed, this command causes **xzmore** to skip the next file and continue.

For list of keyboard commands supported while actually viewing the content of a file, refer to manual of the pager you use, usually **more**(1).
